

Urban inference can belong near demand

Cheap land pulls facilities outward.
Interactive AI pulls compute toward users.
Existing urban infrastructure may make that trade worthwhile.

Density raises costs and creates synergies

Power capacity, fiber performance and parcel availability remain unverified.

Metro proximity can support a 30-year strategy

DEMAND ANCHOR

Residents and firms change location gradually. Latency-sensitive demand may stay tied to the metro.

LAND OPTION

Suburban sites near fiber and grid are scarcer than rural acreage. Preserve expansion room early.

DURABLE LINKS

Power, carrier and heat links can outlast GPUs. Refresh hardware and reroute work as demand changes.
